

Task Management: put it online for free

One-time setup, about 30 minutes. After this you have your own link that works on any phone or tablet, and your tasks sync between them. No credit card needed. You only need your Google (Gmail) account.

You will use 2 free things: Firebase (stores your tasks and signs you in with Google) and GitHub Pages (hosts the app so it has a link). The button names below are how they looked when this guide was written. If one looks slightly different, pick the closest one.

Part 1: Firebase (your private storage)

1. Go to **console.firebase.google.com** and sign in with your Gmail.
2. Click **Create a project** (or Add project). Name it task-management. Turn **off** Google Analytics. Click Create, then Continue.
3. In the left menu open **Build > Authentication**, click **Get started**, choose **Google**, switch it **Enable**, pick your Gmail as the support email, click **Save**.
4. Left menu **Build > Firestore Database**, click **Create database**. Choose a location close to you (it cannot be changed later), choose **Production mode**, click Create.
5. In Firestore open the **Rules** tab. Delete everything there and paste the text below (also in the file `firestore.rules`). Click **Publish**. This makes sure only you can read your own tasks.

```
rules_version = '2';
service cloud.firestore {
  match /databases/{database}/documents {
    match /users/{uid}/{document=**} {
      allow read, write: if request.auth != null && request.auth.uid == uid;
    }
  }
}
```

Part 2: Connect the app to your Firebase

1. In Firebase click the **gear icon > Project settings**. Scroll to **Your apps** and click the web icon `</>`.
2. Give it any nickname (for example web). Do not tick Firebase Hosting. Click **Register app**.
3. You will see a block of code with `firebaseConfig = { apiKey: ..., authDomain: ..., ... }`. Copy the values inside the braces.
4. Open the file **firebase-config.js** from the app folder in any text editor (Notepad works). Replace each `PASTE...` value with yours. Keep the quotation marks. Save.

This key is not a password. It is normal for it to be visible. The rules in Part 1 are what keep your data private.

Part 3: Put the app online with GitHub Pages

1. Go to **github.com** and create a free account (or sign in).
2. Click **+ > New repository**. Name it **tasks**. Choose **Public**. Click **Create repository**. (Only the app files are public. Your tasks are never in it.)
3. Click **uploading an existing file**. Drag in **all the files** from the app folder (index.html, sync.js, firebase-config.js, sw.js, manifest.webmanifest and the 4 icon files). Click **Commit changes**.
4. Open **Settings > Pages**. Under Branch choose **main** and folder **/ (root)**, click **Save**.
5. Wait 1 to 2 minutes and refresh. Your link appears at the top, like <https://YOURNAME.github.io/tasks/>.

Part 4: Allow your link to sign in

1. Back in Firebase open **Authentication > Settings > Authorized domains**.
2. Click **Add domain** and type only `YOURNAME.github.io` (no https, no /tasks). Click **Add**.

Part 5: Use it

1. Open your link. Tap the small pill at the bottom left, **Sign in with Google**, and choose your Gmail.
2. It should say **synced**. Do the same on your phone and tablet. Changes appear on the other devices. If you edit on one while another is open, tap **Refresh** when it appears.
3. On your phone, add it to the home screen: iPhone (Safari) **Share > Add to Home Screen**. Android (Chrome) **menu > Install app**.
4. Already have tasks in the old version? Use **Backup** there, then **Restore** in the new link once. They sync from then on.

Good to know

- Attached documents and your song stay on the device where you added them. They are not synced.
- Use **Backup** now and then and keep the file somewhere safe. It is your safety copy.
- Free plans can change. Your usage is tiny compared with the free allowance.
- Stuck? Send me a screenshot of the step and I will guide you.
